FlexStore Pro™

Get more control over data residency while accessing files quickly.

With FlexStore Pro, you can now easily store and process documents closer to the people who access them the most. Utilising our Distributed Cryptographic Service, you can now enjoy more control over where your firm stores its data and where that data is encrypted/decrypted.

Bringing the processing closer to your users greatly reduces wait time from data being transmitted long distances for decryption. Your users can enjoy a smoother user experience, faster access and more control over data residency.

FlexStore Pro Delivers:

Improved User Experience
FlexStore Pro's unique structure allows you to move the document decryption process closer to your users, meaning less variability in download times without sacrificing the NetDocuments security.

Faster Document Access
Transmitting files across vast distances for processing takes time and waiting to access a document can be frustrating. With FlexStore Pro, you can store and decrypt documents closer to users who access them, improving the speed at which people can retrieve their documents.

Enhanced Processing for Compliant Storage
Using the Distributed Cryptographic Service can enhance performance for users when you are using Flex Store options to meet regulatory drivers for storing your data within a specific geography or jurisdiction.
